

Stage 3 Kineo Evaluation Report

1. Assignment Brief

The application is a modern adaptation of a travelling system. It integrates the power of Artificial Intelligence in creating a proper itinerary and planning optimized trip recommendations based on the user's liking.

The system aims to eliminate the challenges and inconvenience associated with the tedious booking process by providing a user-friendly interface that allows users to have direct and easy selection with their preferred option.

2. Requirements

The main requirements of the system are the following:

1. A secure and reliable login and signup process.
2. Safe and efficient storage of user information within the database.
3. Accurate and responsive auto-complete response.
4. A comprehensive, fast, and precise AI-generated itinerary.
5. Prevent APIs from overloading.

3. Strength and Weakness of the Application

Strengths:

1. Auto-complete searching - allow users to have an easier searching process of destination.
2. Card Destinations - promotes simpler and straightforward selection of different destinations.
3. Effortless option comprehensibility - features user-friendly option selection.
4. Login process - User information is acquired and saved for faster future logins.
5. No login required - if a user only wants to browse the application without logging in, it is possible.

Weaknesses:

1. API dependent - when APIs are completely used up, error will show up as it is needed in the searching and itinerary generation aspect.
2. Slow picture generation - some pictures are displayed maybe displayed slowly, which directly affects user experience.

3. Not optimized for android use.

4. Modifications to Initial Project Plan

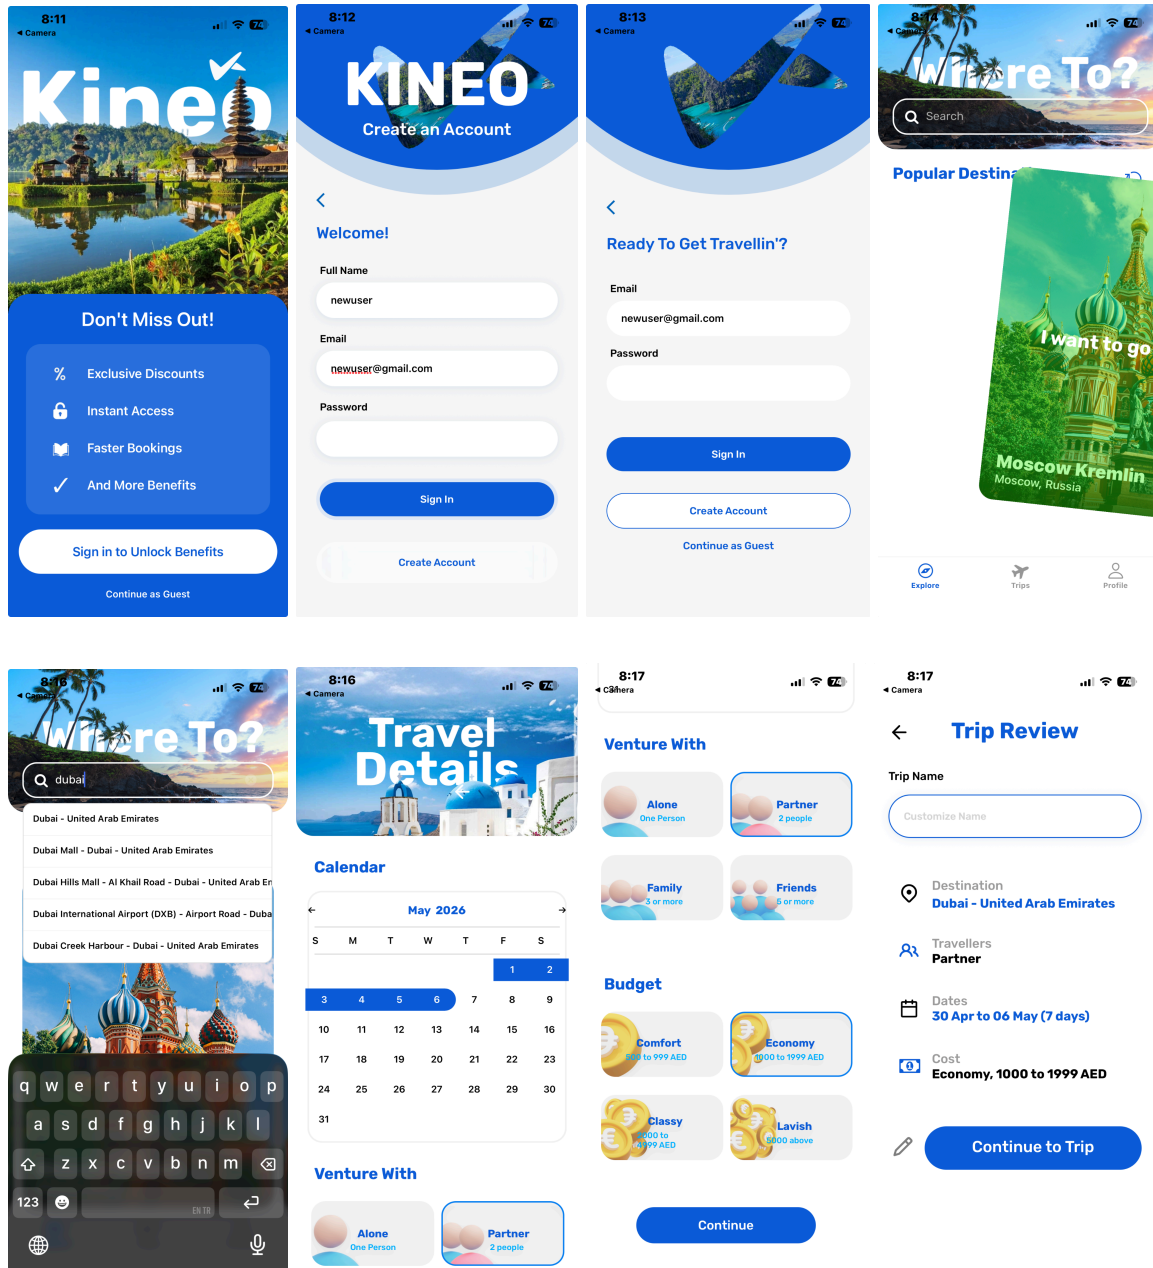

The following changes were made to the initial project plan:

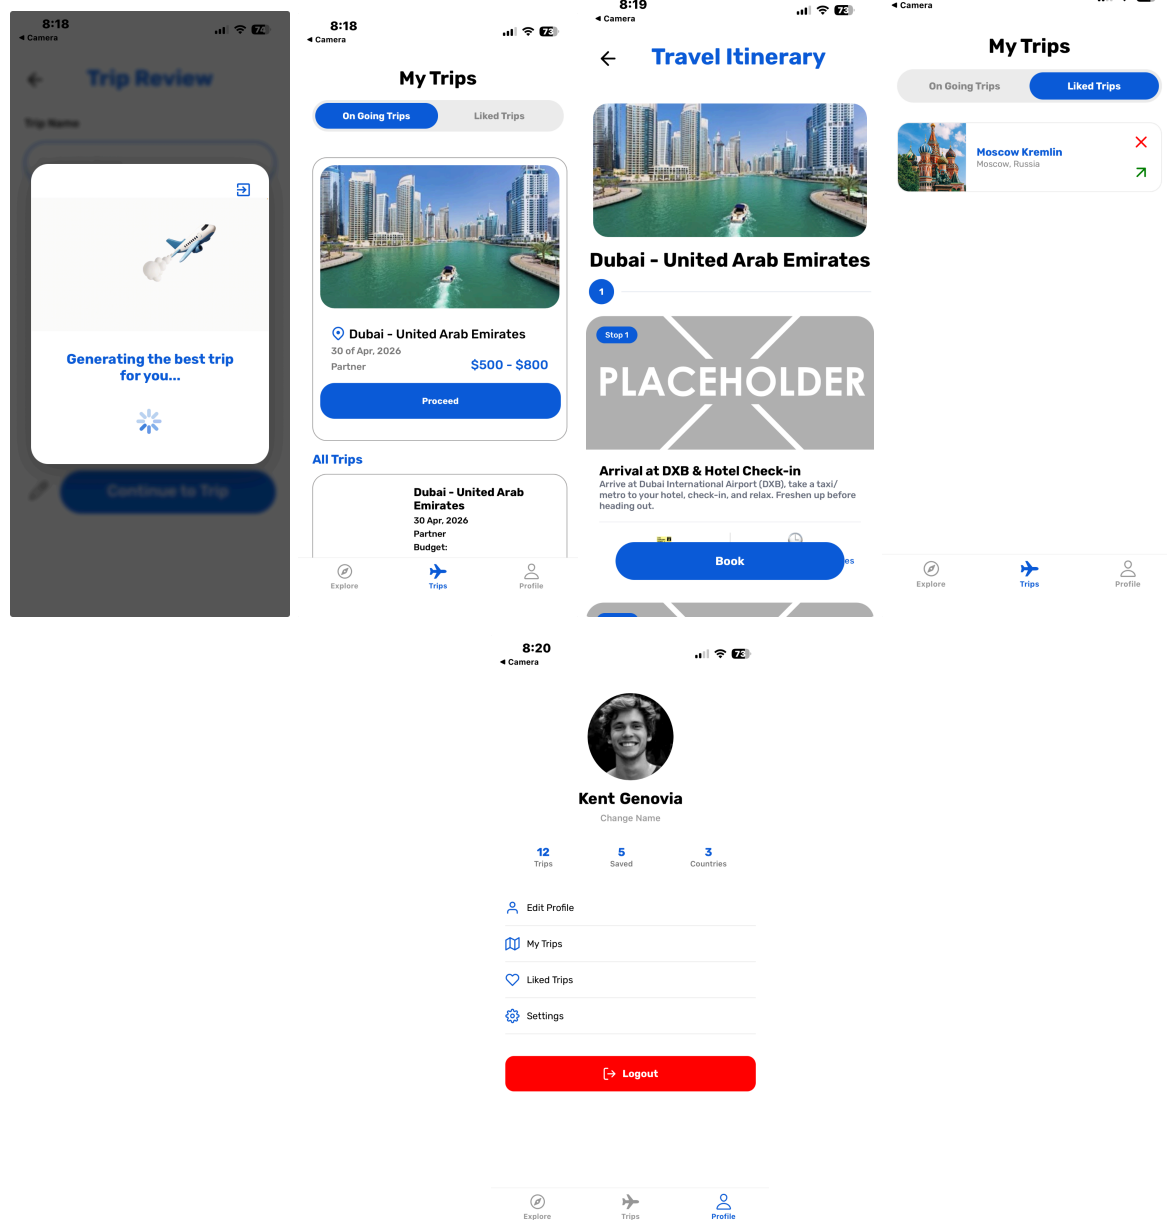

1. Card destination uses API to create random places.

5. Knowledge Developed During The Project

1. Learning a new coding language (React Native).
2. Have a little knowledge in making mobile applications.
3. Connecting a database from the app.
4. Managing and integrating APIs.

6. Final Design

7. Future Scope

Multiple changes can be implemented to make the system much more smoother, secure, and overall better. We can start with the usage of paid APIs, with this, usage will not be limited and users can freely interact with the features without any problems being met. Second, upgradation of the database, when the application grows more users, a bigger and more secure handling of user information is needed to prevent leakage and confidential information being declared. And lastly, a map of the world must be added to provide a better user experience.
